

What went well

- Our team planned well ahead, and everyone met up in person in the lab when we did some testing
- We were able to finish the visionOS app with all features requested from our sponsor except for accessing the main camera on the headset because the Apple Developer Program account was never given access from Apple
- We successfully sent request using voice recognition to OpenAI and displayed the results from OpenAI to users
- We were able to implement security measures recommended to us from our cyber security team
- We were able to create a website for documentation about our project for further work
- We addressed concerns from the cybersecurity team to make our software more secured

What didn't go well

- In the end, Dr. Crawford could not set up the account for the Apple Developer Program to make a request for entitlements to access the API for the main camera of the Apple Vision Pro.

What could be improved

- Not all security features were implemented, but this was because our cyber team feared it may make starting up the application too difficult for someone who did not create it

Challenges

- Work on unit testing in Xcode
